

Week Two Technical Report

Trainee: David Karanja

Trainer: Brian Kemboi

Date: September 26, 2025

Teach2Give QA & QE Training Program

Overview

This week introduced the basics of TypeScript. We learned how to set up Node and package managers so that TypeScript programs could run, and practiced the language through simple coding exercises that showed how TypeScript improves code structure and enhances clarity in programming.

Training Modules Covered

We began the week by installing Node and setting up TypeScript. After that, we wrote programs that used variables, objects, arrays, tuples, functions, and control flows. Mid-week, the sessions focused on loops, ES6 features, and fetching API data. The week ended with a DOM manipulation project that applied the different ideas we had practiced earlier.

Practical Exercise and Project

This week's project was a Movie Watchlist Application developed using HTML, CSS, and JavaScript DOM manipulation, designed around the principles of CRUD (Create, Read, Update, Delete) operations, where users can add new movies, view their full watchlist, modify and even remove movie titles through an edit and delete icons from FontAwesome. The website has been deployed, enabling live interaction and testing, which showcases not only its functionality but also its readiness for practical use.

Challenges Faced

My computer broke down, which slowed my progress significantly. Some tasks from last week were pushed to this week because they were lost when my machine broke down. I had to redo them while still continuing with the new training, which made catching up with the rest of the group more demanding. This required extra time and effort to stay aligned with the program.

Recommendations

I find that reaching out to the trainer and peers and having reliable equipment is important to keep up with the pace of the program and makes it easier to stay on track when

setbacks occur.

I'd also encourage use version control tools like GitHub to back up my work regularly, instead of waiting until the end of a task, so as to avoid losing progress if anything goes wrong.

Conclusion

This week marked steady progress in both the training modules and practical exercises. Despite the challenges faced, I managed to stay on track with the program by redoing lost tasks and keeping pace with the ongoing sessions. The experience emphasized the importance of resilience and consistency in learning, as well as the value of reliable tools and version control in avoiding setbacks. Overall, the week strengthened my ability to adapt under pressure while continuing to grow technically.
