

Week Ten Technical Report

Manual Testing, Automation, and Cloud Deployment with Azure

Trainee: David Karanja

Trainer: Brian Kemboi

Date: November 23, 2025

Teach2Give QA & QE Training Program

Overview

Week 10 focused on expanding my knowledge in quality assurance and cloud computing. The main topics covered were manual testing, automation frameworks (Cypress), and cloud deployment using Microsoft Azure. The sessions combined theory and practical exercises, emphasizing the workflow from test case creation to cloud deployment.

Training Modules Covered

We began by creating and executing manual test cases for sample applications. This involved writing test scenarios. We ensured that each test case was clear and reproducible, which allowed us to track bugs effectively and report them accurately.

Next, we used Cypress to automate some of the test cases we had written manually. We practiced writing scripts to simulate user actions, such as clicking buttons, filling forms, and verifying page content. Running these automated tests allowed us to validate application functionality more efficiently and to quickly identify any issues that required attention.

Finally, we deployed a sample application to Microsoft Azure. We built the application locally and then deployed it to the cloud, ensuring that the correct runtime environment was used. After deployment, we tested the application through the Azure portal, checking dashboards and APIs for proper functionality. We also practiced managing resources by stopping or deleting them using Resource Groups, which reinforced best practices for cloud cost management and security.

Practical Exercise and Project

Created manual test cases and executed them, reporting defects. Practiced writing automation tests in Cypress. Deployed sample applications to Azure, tested login and dashboard access, and managed resources. Gained experience in QA best practices.

Challenges Faced

The main challenge this week was catching up with the pace of practical exercises and dealing with bugs that arose during testing and deployment. Writing and executing manual test cases revealed unexpected defects, which required careful debugging and attention to detail. Similarly, automating tests in Cypress and deploying applications to Azure presented issues such as runtime errors and resource management problems, which needed patience and systematic troubleshooting to resolve.

Recommendations

To address the challenges faced this week, I recommend regularly practicing both manual and automated testing to become more comfortable with identifying and resolving bugs. Taking time to carefully review test cases before execution can help reduce errors.

Conclusion

Week 10 strengthened my QA foundation through manual testing, automation, and cloud deployment exercises. The combination of testing frameworks and Azure cloud exposure enhanced my practical skills, enabling me to write, execute, and deploy tests efficiently while managing cloud resources securely.
